

# HOW IT WORKS

## WHAT REALLY HAPPENS WHEN I FLUSH?

Here is how it works. Above is the general flow of water from your home or business to our treatment plant where we clean the water and send it back into Trail Creek.

**Of course, it starts from:**

1. The toilet in your home and businesses.
2. It then flows to a lateral
3. From the laterals it flows to the main lines which are connected to one of the 47 pump stations in the district.
4. Our pump stations then pump it all the way to our Treatment plant at 1100 E. 8<sup>th</sup> St.
5. Through a course of treatment within the plant, our final product is clean water that flows from the plant back into Trail Creek located right behind our property.
